Post-upgrade cluster verification	 	 	
Verify cluster version	 	 	
Verify cluster health	 	 	
Verify storage health	 	 	

## Post-upgrade cluster verification

After you upgrade you should verify your cluster version, cluster health, and storage health.

## Verify cluster version

After all of the HA pairs have been upgraded, you must use the version command to verify that all of the nodes are running the target release.

The cluster version is the lowest version of ONTAP running on any node in the cluster. If the cluster version is not the target ONTAP release, you can upgrade your cluster.

- 1. Verify that the cluster version is the target ONTAP release: version
- 2. If the cluster version is not the target ONTAP release, you can verify the upgrade status of all nodessystem node upgrade-revert show

## Verify cluster health

After you upgrade a cluster, you should verify that the nodes are healthy and eligible to participate in the cluster, and that the cluster is in quorum.

1. Verify that the nodes in the cluster are online and are eligible to participate in the cluster: cluster show

If any node is unhealthy or ineligible, check EMS logs for errors and take corrective action.

- 2. Set the privilege level to advanced: set -privilege advanced
- 3. Enter y to continue.
- 4. Verify the configuration details for each RDB process.
  - The relational database epoch and database epochs should match for each node.
  - The per-ring quorum master should be the same for all nodes.

Note that each ring might have a different quorum master.

To display this RDB process	Enter this command
Management application	cluster ring show -unitname mgmt

To display this RDB process	Enter this command
Volume location database	cluster ring show -unitname vldb
Virtual-Interface manager	cluster ring show -unitname vifmgr
SAN management daemon	cluster ring show -unitname bcomd

This example shows the volume location database process:

5. If you are operating in a SAN environment, verify that each node is in a SAN quorum: event log show -messagename scsiblade.\*

The most recent scsiblade event message for each node should indicate that the scsi-blade is in quorum.

```
cluster1::*> event log show -messagename scsiblade.*

Time Node Severity Event

MM/DD/YYYY TIME node0 INFORMATIONAL scsiblade.in.quorum: The scsi-blade ...

MM/DD/YYYY TIME node1 INFORMATIONAL scsiblade.in.quorum: The scsi-blade ...
```

6. Return to the admin privilege level: set -privilege admin

### Verify storage health

After you upgrade a cluster, you should verify the status of your disks, aggregates, and volumes.

1. Verify disk status:

To check for	Do this		
Broken disks	<ul><li>a. Display any broken disks: storage disk show -state broken</li><li>b. Remove or replace any broken disks.</li></ul>		
Disks undergoing maintenance or reconstruction	a. Display any disks in maintenance, pending, or reconstructing states: storage disk show -state maintenance pending reconstructing		
	b. Wait for the maintenance or reconstruction operation to finish before proceeding.		

2. Verify that all aggregates are online by displaying the state of physical and logical storage, including storage aggregates: storage aggregate show -state !online

This command displays the aggregates that are *not* online. All aggregates must be online before and after performing a major upgrade or reversion.

```
cluster1::> storage aggregate show -state !online
There are no entries matching your query.
```

3. Verify that all volumes are online by displaying any volumes that are *not* online: volume show -state !online

All volumes must be online before and after performing a major upgrade or reversion.

```
cluster1::> volume show -state !online
There are no entries matching your query.
```

4. Verify that there are no inconsistent volumes: volume show -is-inconsistent true

If any inconsistent volumes are returned, you must contact NetApp Support before you precede with the upgrade.
